⚠️ Action needed	The website certificate for harbour-orders.example expires on 19 Oct. Check automatic renewal with the host.
✓ No action needed	Mail records for harbour-shop.example changed on 12 Sep, as planned for the move to the new email service.

Top 3 recommended fixes

We can make any of these changes for you: just reply to this email.

1

Move DMARC to quarantine, then reject

About 10 minutes

Why it matters

DMARC tells mail servers what to do with emails pretending to be from you. Until it's strict, fakes can still reach inboxes.

For 2 domains: harbourbakery.example, harbour-orders.example

What to do

Once the reports show every genuine sender passing, change p=none to p=quarantine, then to p=reject after a few clean weeks.

2

Set up MTA-STS

About 15 minutes

Why it matters

These settings make sure email sent to you travels over an encrypted connection, so it can't be read on the way.

For harbour-orders.example

What to do

Publish an MTA-STS policy file listing your mail servers and a matching TXT record at _mta-sts, starting in testing mode.

3

Add a TLS-RPT record

About 15 minutes

Why it matters

These settings make sure email sent to you travels over an encrypted connection, so it can't be read on the way.

For harbour-orders.example

What to do

Add a TLS-RPT record (a TXT record at _smtp._tls on the domain) with a report address, to hear about delivery failures.

Email authentication

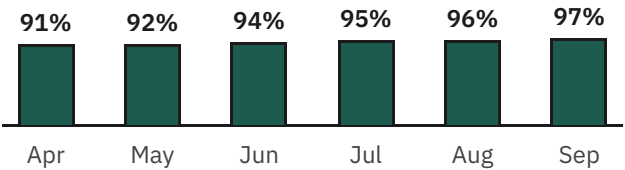

96.7%

of the 7,410 emails sent from your domains in September 2026 passed SPF, DKIM and DMARC: the checks that prove they're genuinely from you, so they reach inboxes and can't easily be faked.

BY DOMAIN, SEPTEMBER 2026

harbourbakery.example		97%
harbour-shop.example		100%
harbour-orders.example		86%
harbour-bakery.example		Sends no email
